Why two different ways of output the same thing? A: From The Java Tutorial: The FileOutputStream class is an implementation of the java.io.OutputStream interface, which provides a simple output stream that writes bytes to a file. It replaces the old BufferedOutputStream class. It's using the PrintStream because it wants to use some custom formatting to write the output. If you're using the PrintStream interface, it's up to you to decide whether to use the default system fonts (as with Buffered

Our tool is a reliable diagnostic, network monitoring and management solution that enables you to keep track of and access all the performance statistics for your networks. The most important features are bandwidth and latency monitoring for the whole network, individual device measurement, reporting of real-time statistics, customizable charts and graphs, as well as the ability to log and save the entire activity to an.htm file. The easy-to-use graphical interface allows you to quickly adjust all the required options for your individual needs in order to optimize the measurements and maintain your network. Device Account Management: Each device can be assigned a user who can access its performance statistics. Furthermore, you can specify the host system, OS and even the IP address or network if required. After you create an account, you can choose the reported bandwidth and latency metrics and click the start button to perform the measurements. The following network parameters can be viewed: •Incoming Traffic: Total amount of data received from the network. •Outgoing Traffic: Total amount of data transmitted to the network. •Received Packets: Total amount of data received from the network. •Sent Packets: Total amount of data transmitted to the network. •Routing Discards: Total amount of data discarded during data transmission due to routing problems. •Received Unknown Protocols: Total amount of unknown protocols received during data transmission. •Received Fragments: Total amount of data received from the network but not as a whole. •Output Request: Total amount of data sent to the network. •Received Packets per Second: Total amount of data received from the network per second. •Received Packets per Second per Host: Total amount of data received from the network per second per host. •Reported Bandwidth: Total amount of data received from the network per second. •Reported Bandwidth per Host: Total amount of data received from the network per second per host. •Reported Latency: Total amount of time it took to receive data from the network. •Reported Latency per Host: Total amount of time it took to receive data from the network per host.
